Your Computer Problem Solution

FixThisSystem

Tune-Up... \$75.00

You click the mouse and leave to get coffee... 'cause ya know it will take that long for your internet to come up. Sound familiar?

If you are fighting a super slow PC, chances are your PC is in need of a tune-up.

A **FixThisSystem Tune-Up** takes several hours to complete. We recommend most tune-ups be done at our facility. The \$75.00 assumes a two day turnaround and **includes pick-up /delivery** within the greater Middleton area.

Tune-Up Details

Physical Cleaning... The number one PC hardware killer is heat. Your system needs constant airflow to maintain a good operating temperature. As the weeks and months go by dust accumulates in the cooling fans, manifolds and air passages. This dust build-up restricts air flow and slows the cooling fans. It can get to a point where your cooling fans seize resulting in major damage to hardware elements such as your main processor and power supply.

Malicious Software Removal... It is nearly impossible to not get infected with some form of malicious software. Some are rather harmless... some will bring your computer to its operative knees. We use a three-fold method to rid your system of malicious software.

Junk Software Removal... Over time your system will accumulate junk... fragmented files, abandoned directories and files that are no longer used. We have a process that looks for these files and removes them. Getting rid of this junk will free up hard drive space and help with performance.

System Updates... We install all the latest relevant operating system updates.

Application Software Updates... All the latest application software updates such as Adobe Reader, Flash, Office, etcetera are installed

Hardware Driver Updates... Current drivers versions for your system's hardware are verified.

Hard Drive Check... The hard drive stores information or data used by your computer: the operating system such as Windows 7 or XP; applications such as Word or Excel or Quickbooks; personal files such as pictures or music. A hard drive check is a process that verifies the physical structure of the hard drive, the file system, and the data stored within that file system. A typical "chkdsk" can take several hours to complete... depending on the size of the hard drive.

File Defragmentation... Lastly we do a low level file defragmentation and optimization on your hard drive. This is a process that aligns files and directories on the hard drive resulting in decreased seek times for the operating system.
